

i use github account form vs code like after i am done if i want to upload that code to the github repo i do

1. git status
2. git add .
3. adding description it added to my repo and also gives contribution green square in profile now i want to create a new folder for mySQL learnings and then i want to join it with GITHUB like i have joined 2 folders already so how can i join vs code with github with full new repo(folder in my pc)

Here's the full process to create a new local folder and connect it to a brand new GitHub repo:

Step 1 — Create the folder on your PC

Make a new folder anywhere on your PC, e.g. `MySQL-Practice`. Open it in VS Code: **File** → **Open Folder** → select your new folder

Step 2 — Create a new repo on GitHub

1. Go to github.com → click the + icon (top right) → **New repository**
2. Give it a name (e.g. `MySQL-Practice`)
3. Keep it **Public** (so contributions count )
4. **Do NOT** check "Add a README" — keep it empty for now
5. Click **Create repository**

GitHub will show you a page with setup commands — keep it open.

Step 3 — Initialize Git in your folder (VS Code Terminal)

Open the terminal in VS Code (`Ctrl + ```) and run these one by one:

```
bash
```

```
git init
```

```
bash
```

```
git remote add origin https://github.com/YOUR_USERNAME/MySQL-Practice.git
```

```
bash
```

```
git branch -M main
```

Replace `YOUR_USERNAME` and `MySQL-Practice` with your actual GitHub username and repo name.

Step 4 — Add a first file and push

Create any file inside the folder (e.g. `README.md`), then:

```
bash
```

```
git add .  
git commit -m "initial commit"  
git push -u origin main
```

The `-u origin main` part links your local folder to GitHub **permanently**. After this first push, for all future uploads you just do your usual:

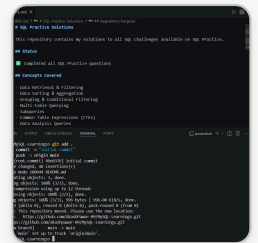

```
bash
```

```
git status  
git add .  
git commit -m "your message"  
git push
```

Why `git push -u origin main` only once?

Command	What it does
<code>git remote add origin <url></code>	Tells Git <i>where</i> GitHub is
<code>git branch -M main</code>	Renames branch to <code>main</code>
<code>git push -u origin main</code>	Pushes + sets default upstream (only needed once)
<code>git push</code> (future)	Works directly after the above

After this, every `git push` will show up as a **green contribution square** on your profile, just like your other two repos. 

is this done

Yes, it's done! ✓

Your terminal output confirms everything worked perfectly:

- `1 file changed, 48 insertions(+)` → your README.md was pushed
- `create mode 100644 README.md` → file was created on GitHub
- `new branch: main -> main` → branch is linked
- `branch 'main' set up to track 'origin/main'` → future `git push` will work directly

Your repo is live at github.com/AkashPawar-09/MySQL-Learnings 🎉

From now on, your usual workflow is back to just 3 steps:

```
bash

git add .
git commit -m "your message"
git push
```

No need for `-u origin main` again. Go ahead and start adding your SQL files!

i want to use only git add .
then will it work ??

No, `git add .` alone won't work. You **need all 3 commands** every time.

Here's why each one is necessary:

Command	What it does	If you skip it
<code>git add .</code>	Stages your changes (marks files as "ready to upload")	Changes won't be included

Command	What it does	If you skip it
<code>git commit -m "msg"</code>	Saves a snapshot of your changes locally	Nothing to push, push will fail
<code>git push</code>	Actually uploads to GitHub	Code stays on your PC only

Think of it like sending a courier package:

- `git add .` → **Pack the items** into the box
- `git commit` → **Seal the box** with a label
- `git push` → **Send the box** to GitHub

You can't send a box that isn't sealed, and you can't seal a box you haven't packed.

The 3 commands are very quick to type though. You can even run them as **one single line**:

```
bash
git add . ; git commit -m "your message" ; git push
```

Paste that in the terminal and all 3 run back to back automatically. 🚀
